There are two ways to open your document. You can choose from a list of them in the File menu and then select **\*\*File > Open...\*\*** or you can just start typing the location of your file in the Open dialog box. The interface is divided into three areas of the screen that communicate how you're viewing your Photoshop document. You can refer to the Scopes area of the window (see Figure 2-11) for a refresher. This area shows you the most important information about the document you are viewing. For example, it will show you the current size of the image and any layers you have created. It will also show you information about the image's transparency mode (not shown in Figure 2-11), which tells you how the alpha layer will influence the transparency of pixels below it. **\*\*Figure 2-11:\*\*** The Scopes area shows you the current size of your document, the number of layers, and whether you have created any masks. various layers you have created. Usually the first layer on your document is a new layer that you've created. Select the layer by clicking on it and then double-click to open the Layer Control dialog box (refer to Figure 2-12). Then, in the Layers area, you can select the Pencil tool and begin drawing on the document, or select the Brush tool and begin painting on the document. The History area of the Photoshop window (refer to Figure 2-11) shows you the various actions you've performed on your image. Click a button to undo or redo the action. If you've created multiple

Long-term effects of CTLA-4 blockade on the rejection reaction against a xenograft: adoptive transfer of anti-CD4 mAb plus interleukin-2 corrects immunodeficiency in a murine model. CTLA-4 is a member of the immunoglobulin superfamily expressed on the surface of T cells. This molecule plays an important role in the regulation of the immune response and is involved in the induction of tolerance. More recently, CTLA-4 has been shown to influence the development of alloreactivity in graft-versus-host disease and has been used as a regulator of the alloresponses in experimental protocols. A murine long-term allograft model involving xenografts was used to assess the effects of CTLA-4 blockade on graft rejection in vivo. CTLA-4 blockade was performed using a combination of the anti-CD4 monoclonal antibody (mAb) GK1.5 and human IL-2. This association was used to avoid the confounding effect of mAb and IL-2 administration on the CD4+ T-cell compartment. GK1.5/IL-2-treated animals showed decreased rejection rates and decreased serum levels of antibodies to the donor cells. Transfers of splenocytes from these treated animals into untreated recipients failed to induce a reaction against the donor cells, indicating that a protective effect of CTLA-4 blockade had been transferred to recipients. The antigen-specific responses of the recipients were significantly diminished and the CD4+ T-cell population was decreased. These results represent a model of CTLA-4 blockade in vivo that has high predictive value. They indicate that CTLA-4 blockade may be considered as a new therapeutic modality in organ transplantation.

Q: How to make Jinja2 inline expression In Jinja2's filters documentation, it states this: Each of those functions has a "parameters" parameter which allows for the interpolation of placeholders inside that function. I tried this: `def check_for_some_category(request): return { 'exists': { 'name': 'test' } }` and `{{ exists.name }}` produces a tag interpolation error in the template. Any suggestions how to use
